CHEATSHEET – DEPLOYMENT

Table of Contents

INITIALIZE

First thing to do would be to instanciate a script that would pull the latest revisions from the git repository. To do so, go to the git repository, and instanciate a git.php file, and add those lines :

> `git checkout master`
>
> `git pull`
>
> echo "latest pulled"

Note the use of backquote. It is really important as it tells php parser to execute these lines in the console. What it does is that it checkout to the master branch, and pulls it.

To see it in action, just go to the *http://website_url/wp-content/path-to-file*

ADD A WEBHOOK

Go to the bitbucket repository, then settings and webhooks.

Here, you can add a webhook so that it goes to the url *http://website_url/wp-content/path-to-file* whenever a push is made, or a merge is done...

This is basically the same for very git client.
Bitbucket -> settings -> webhooks
